

IFISC: Institute for Cross-Disciplinary Physics and Complex Systems

Joint Research Institute of CSIC and UIB

* Exploring emergent phenomena
in the physical, technical, biological and social world.

IFISC: Institute for Cross-Disciplinary Physics and Complex Systems

Joint Research Institute of CSIC and UIB created in June 2007 building upon the former Cross-Disciplinary Physics Department of IMEDEA (1995)

*** Mission: Cross-Disciplinary** and **Strategic** research in Complex Systems following the established scientific approach of physicists.

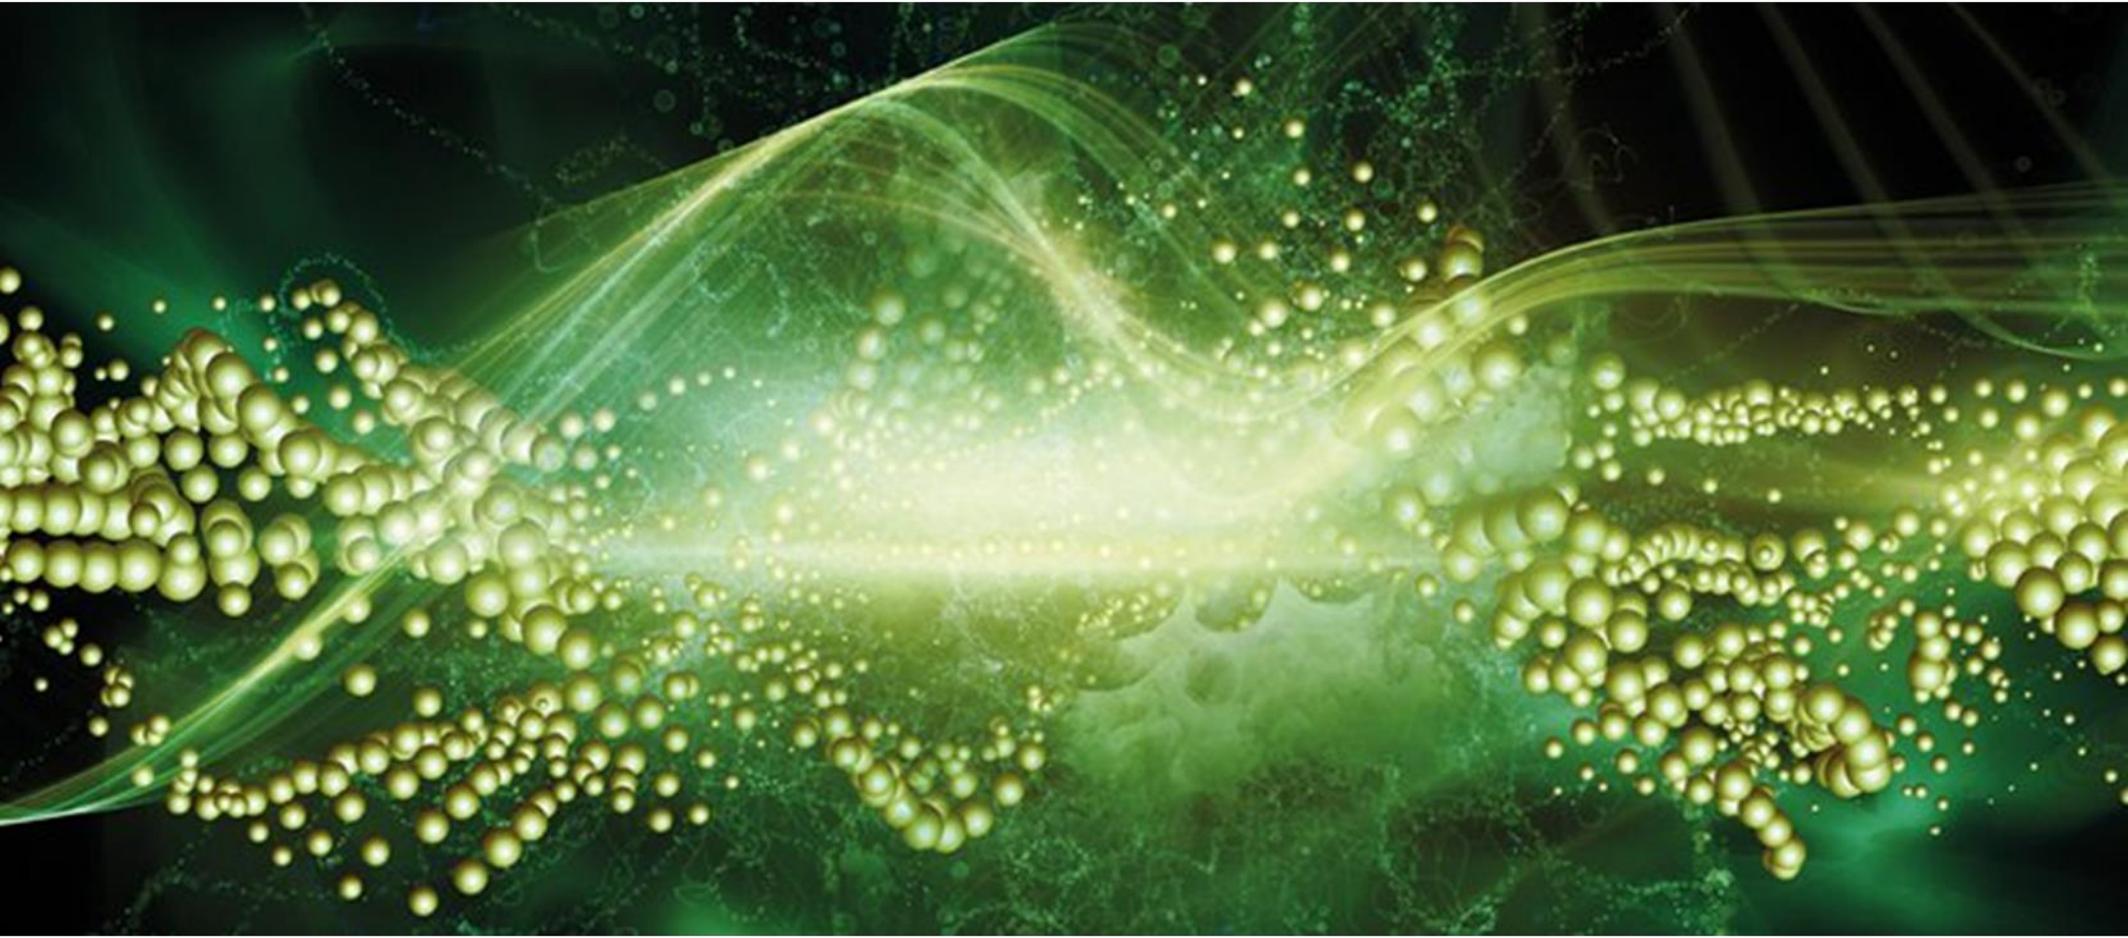

Cross-Disciplinary: Transfer of knowledge, concepts and methods to create bridges among traditional disciplines

Strategic: Focusing on advanced studies in emerging strategic fields with a strong potential impact, beyond the traditional physics of the XXth century. Avoid incremental research and the basic-applied polarization

*** IFISC ASSESSMENT Strategic Plan CSIC 2010-13**

“IFISC is unique in the Spanish context and also has internationally a very strong standing. It challenges the world best centres and it is a major actor of emergence of complex science.”

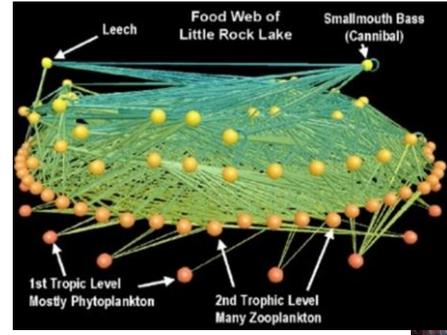

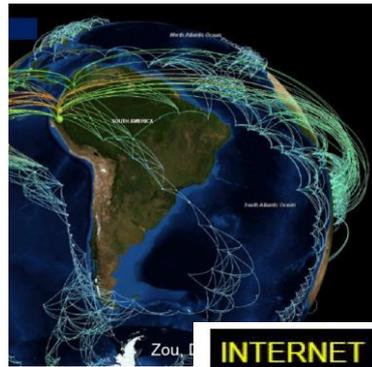

* Connecting Science, Understanding Complexity

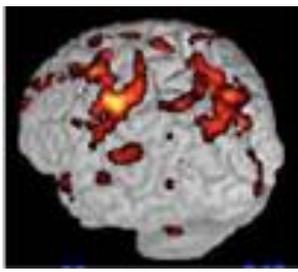

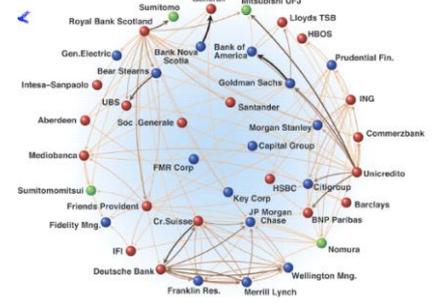

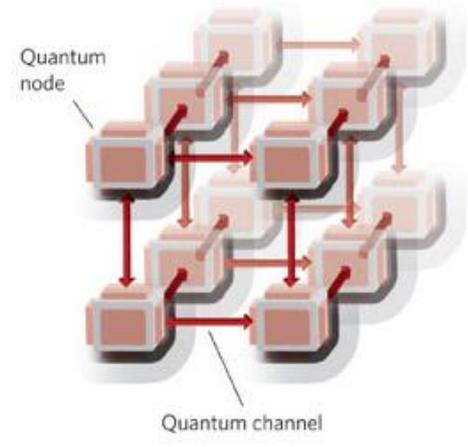

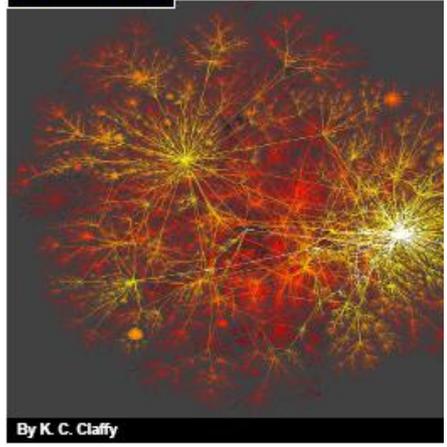

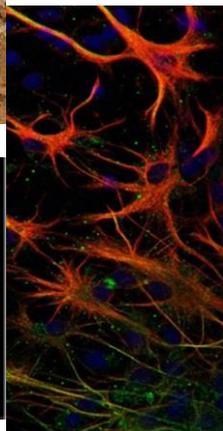

Exploring emergent phenomena
in the physical, technical, biological and social world

Complex Systems Society:

Complex systems are systems where the collective behavior of their parts entails emergence of properties that can hardly, if not at all, be inferred from properties of the parts. Examples of complex systems include ant-hills, ants themselves, human economies, climate, nervous systems, cells and living things, including human beings, as well as modern energy or telecommunication infrastructures.

COMPUTING and BIG DATA

Data mining

Data harvesting

- File download**
text-like, image-like files, geospatial data, ...
- APIs**
set of method definitions and tools for building software
- Web scraping**
technique in which a computer program extracts data from human-readable output coming from another program (a website)

Data storage and preprocessing

- Storage**
Files for specific formats such as geographical data: shp, geojson, ... image-like data: png, svg, eps, pdf, ...
MongoDB database for both structured and non-structured data
- Preprocessing**
Gathered data might have errors and inconsistencies. Some tasks have to be done before analysis: cleaning irrelevant and redundant data, extraction of selected data, transformation to a suitable format

Data sources

- Data gathering**
flightradar24, MarineTraffic, iStock, iStock, iStock
- Agreements**
BBVA, RED ELÉCTRICA DE ESPAÑA, cuebaq, Sabre

Analysis and modelling

- ICT data validation for urban mobility**
PLoS ONE 9, e105184 (2014)
- Tweets on the road**
PLoS ONE 9, e105407 (2014)
- City hotspots**
Nature Communications 6, 6007 (2015)
- Influence of sociodemographic characteristics on human mobility**
Scientific Reports 5, 10075 (2015)
- Modeling land use in cities**
Royal Society Open Science 2, 150449 (2015)
- Twitter, mobility and city influence**
J. Royal Soc. Interface 12, 20150473 (2015)
- Touristic site attractiveness**
EPJ Data Science 5, 12 (2016)
- Dialect characterization**

NONLINEAR PHOTONICS

Semiconductor Lasers (SL)

- versatile and modern photonic sources
- interesting physics: laser and cavity physics, nonlinear (semiconductor) optics, complex dynamics, ...
- small size, electr. pumping, high efficiency
- multitude of structures, materials, wavelengths, power ranges
 - structures: Fabry-Perot, DFB, DBR, VCSEL, multi-section, μ -cavities, Photonic Crystal cavities, Photonic Integrated Circuits, ...
 - active media: quantum wells, quantum dashes, quantum dots, quantum cascade structures
 - wavelengths: UV ... FIR (THz)
 - power ranges: μ W ... kW
- particularities
 - fast time scales of the dynamics (ns..ps)
 - semiconductor band structure high gain bandwidth, high gain
 - strong nonlinearities in the interaction light - semiconductor medium

Main Research Activities

- nonlinear semiconductor laser emission properties
 - fundamental emission properties
 - semiconductor lasers as complex systems lab
- controlling and tailoring SL emission properties
 - controlling dynamical instabilities and synchronization
 - controlling temporal and spatial coherence
- dynamics of (delay-)coupled SL systems
 - dynamical instabilities
 - synchronisation properties
- utilization of complex dynamics, functional chaos
 - communication using chaotic carriers, key exchange
 - random number generation
 - information processing
 - optical coherence tomography

Nonlinear SL Emission Properties

- SL exhibit dynamical instabilities under various conditions
 - current modulation, light injection, or delayed optical feedback
 - high-power edge emitters (broad area lasers)
 - broad area VCSEL
- semiconductor lasers as complex systems lab
 - study of delayed feedback instabilities
 - instabilities in several applications due to delayed feedback from fibre or CD, DVD, ...
 - delay renders the system dynamically infinite dimensional
 - aspects: dynamics, bifurcations, mechanisms, chaos-control, interaction with noise
 - excellent testbed, has boosted studies of delay-systems
- characterizing picosecond spatio-temporal emission
 - emission characteristics of standard Datacom-VCSEL
 - emission characteristics are a "fingerprint" of light-semiconductor interactions: spatial hole burning, spectral hole burning, temperature effects, ...
 - interactions lead to complex dynamical behaviour

Controlling and Tailoring SL Emission

- tailoring spatial coherence
- broad area VCSEL
 - cw operation: emission in large number of transverse modes
 - μ s-pulsed operation: only slightly blurred nearfield, but drastically changed farfield! (Gaussian)
 - origin: breakdown of modal emission
 - possible applications: speckle-reduced source, projection

Experimental / Characterization Methods

- modern photonics lab
 - multitude of photonic sources
 - various characterization techniques
- temporal characterization of emission dynamics
 - multichannel 10GHz real-time acquisition
- spectral characterization of emission dynamics
 - real-time spectrum analysis with 14 GHz bandwidth
 - spectral analysis with 30 GHz bandwidth
- optical characterization
 - grating spectrometers
 - Fabry-Perot spectrometers
- spatio-temporal characterization with
 - picosecond resolution
 - polarization resolution
 - spectral resolution

Utilization of Complex Dynamics

- communication using chaotic carriers / key exchange
- principle:
 - generation of suitable chaotic carrier by the Transmitter
 - encryption of message by mixing it within the chaotic carrier of the Transmitter
 - transmission of entire signal to (matching) Receiver
 - chaos synchronisation if, and only if, Receiver is a "Twin system"
 - extraction of data via comparison of Transmitter and Receiver signal
- it works:
 - chaos generation and synchronisation
 - signal extraction
 - field experiment in the Metropolitan Area Network of Athens
 - 100 km fibre
 - transmission at $t = 1552$ nm
 - BER: 10⁻⁷ for 1.0 Gbit/s transmission with NRZ PRBS

Utilization of Complex Dynamics II

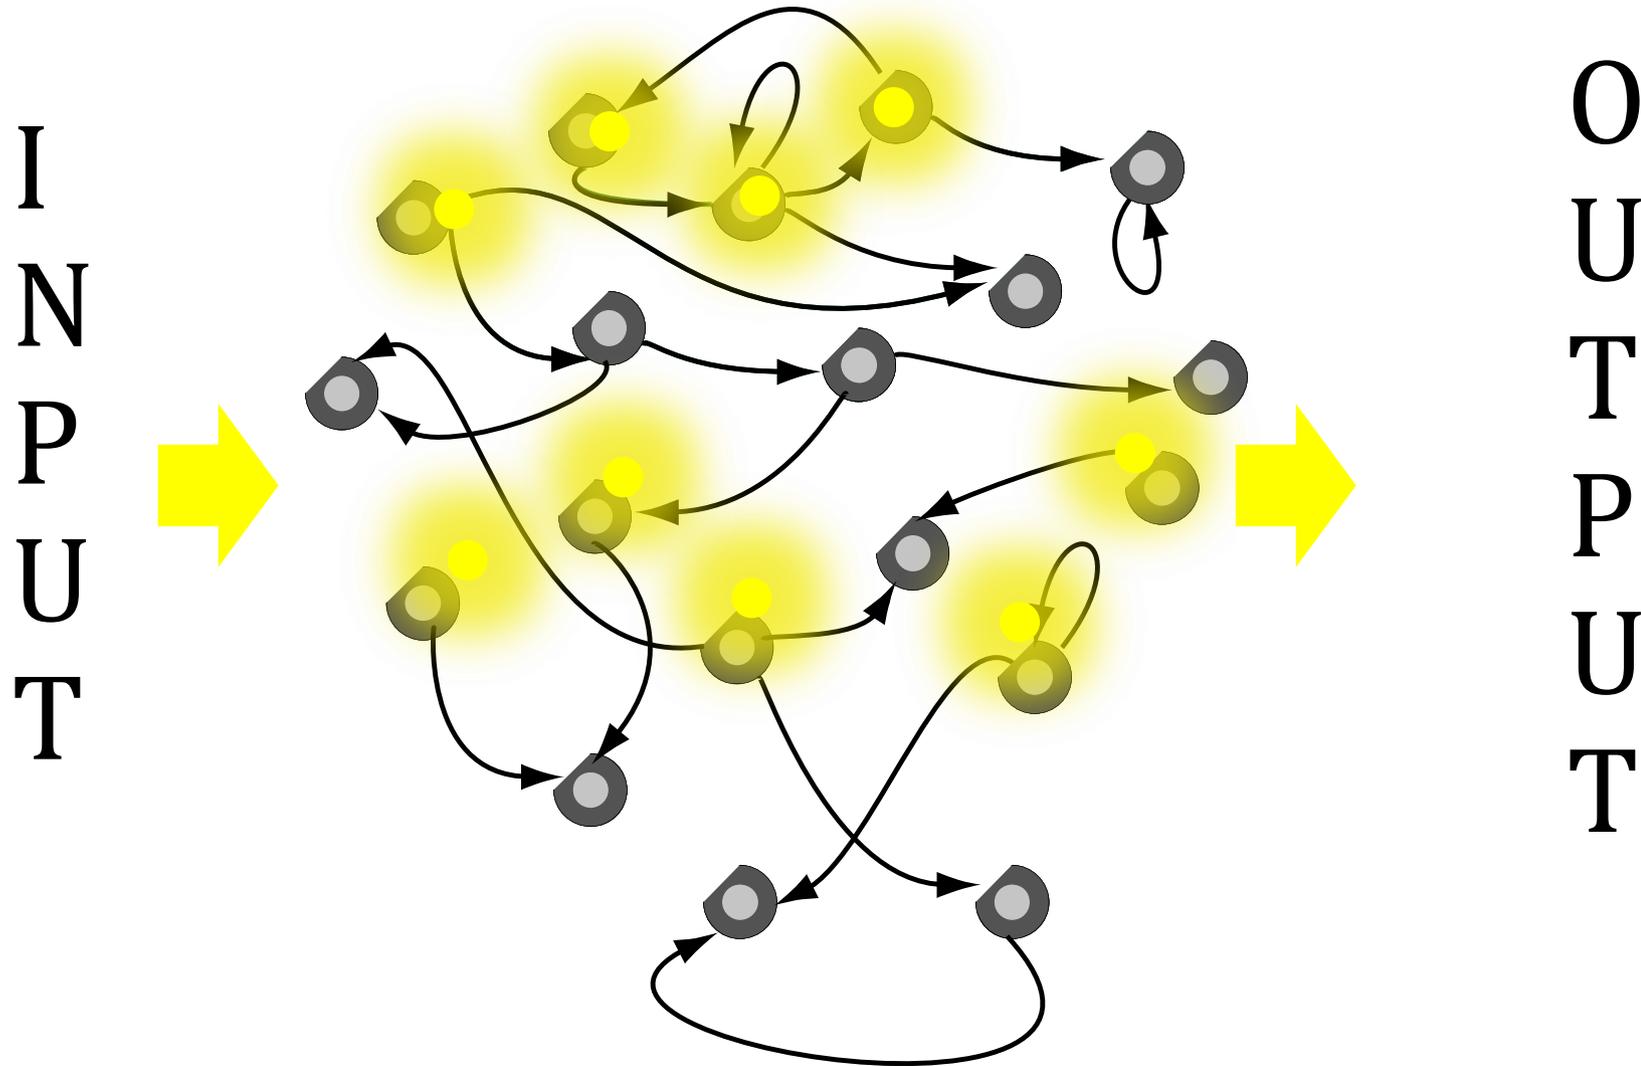

- Generation of random bit sequences
- principle:
 - utilize unpredictability of chaotic laser dynamics
 - continuous dynamical system with noise avoids periodicities and recurrences
- advantages:
 - high bit-rate sequences
 - optical implementation
- Information processing
 - principle: photonic implementation of a Liquid State Machine
 - information processing based on classification
 - utilizing delay-coupled elements to obtain high-dimensional state-space projection

Current Goals & Future Perspectives

- tailor emission properties using nonlinear physics
- benefit from modern photonic sources
- towards networks of delay-coupled lasers
- develop novel applications based on complex behavior
- bio-mimetic photonic architectures

Information Processing (IP) **in** and **by** Complex Systems

PI: Claudio Mirasso

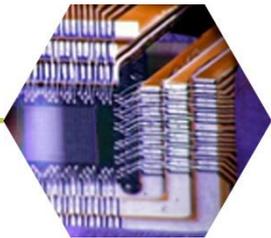

in: Processing, transmission, storage and retrieval of information in complex systems.

by: Designed information processing and sensing.

Complex Systems Science

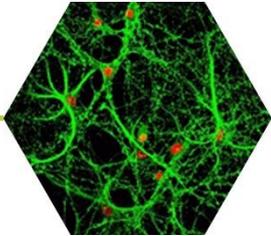

Synthesize novel methods connecting the know-how of the individual fields.

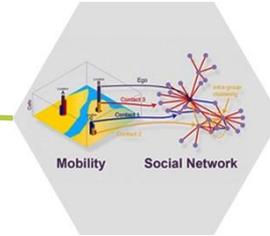

Quantum information processing

Machine learning/brain (-inspired) computing concepts

Bio-Complex Systems

Socio-technical Systems

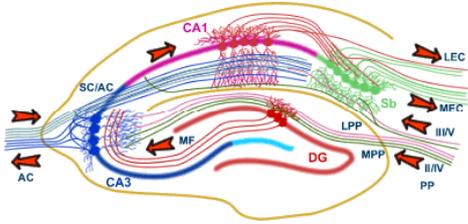

Big-data analysis

Complex Networks Theory

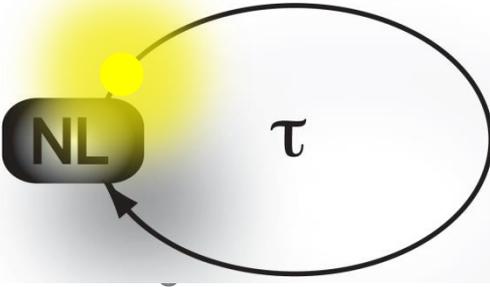

L1: Information processing in biological systems

- Information processing in biochemical networks, brain circuits and structures, and ecological networks
- Genetic diversity in ecosystems and its response to environmental changes
- Biodiversity patterns, especially in microbial communities; alternative ways to encode and store information

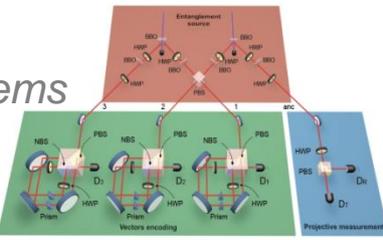

L2: Brain-inspired analog computing in photonic and electronic systems

- Hardware implementations of reservoir computing and their applications in telecom and datacom
- Autonomous operation of recurrent networks
- Development of novel computing concepts, theoretical framework for scaling and

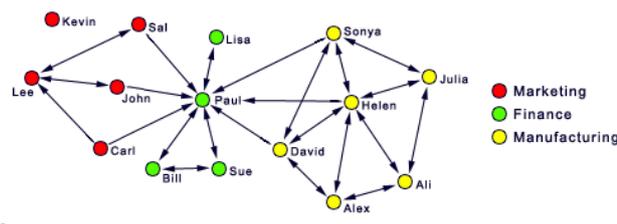

L3: Quantum information: decoherence, dissipation, and transmission

- Emergent quantum phenomena and information retrieval in extended and network systems
- New functionalities based on nanoelectronic devices
- Information processing using quantum materials

L4: Information processing in socio-technical systems

- Evolution of social-system and processing of information: opinion, consensus, meme spreading, fake news, etc.
- Studies of mobility of people and animals;
- Data-driven modeling and response of urban systems to external perturbations.

Welcome

The Master in Physics of Complex Systems is an official degree offered by the University of the Balearic Islands (UIB) in collaboration with the Spanish National Research Council (CSIC). It is organized and taught by [IFISC, the Institute for Cross-Disciplinary Physics and Complex Systems](#), a joint UIB-CSIC research center in Palma de Mallorca, Spain.

COMPLEX SYSTEMS. STATISTICAL AND NONLINEAR PHYSICS

Complex systems are characterized by **emergent** and **collective** phenomena of many interacting units. Fundamental understanding of these systems comes from Statistical Physics together with the Theory of Dynamical Systems, which includes the study of **chaos** and the effect of **fluctuations** and random events on systems evolution.

This research line of exploratory nature is the backbone of **IFISC**: We develop new concepts and methods for the study of **Complex Systems**, and we analyze generic phenomena such as synchronization, phase transitions, nonequilibrium instabilities, spatiotemporal pattern formation, and the dynamics and evolution of complex networks.

TRANSPORT AND INFORMATION IN QUANTUM SYSTEMS

Understanding of Quantum Complex Phenomena plays a key role in the development of Quantum Technologies identified as one of the most strategic areas for future research and innovation.

In this research line, we are devoted to questions related to quantum transport for charge (nanoelectronics), spin (spintronics), energy (thermoelectrics) and information (quantum correlations), with a particular focus on nanostructures.

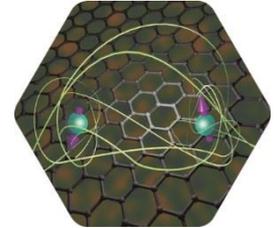

Moreover, we investigate decoherence effects in complex environments, explore quantum probing, and emergent phenomena such as synchronization, with a focus on quantum correlations and thermodynamics and their impact on information processing.

NONLINEAR PHOTONICS

Within this line of research, we explore complex phenomena in photonics, filling the gap between Modern Photonic Sources and Functional Complex Systems.

Our Nonlinear Photonics Lab, working alongside a strong theoretical team, aims to gain an in-depth understanding of complex phenomena and to provide novel solutions from communication to information processing, transferring knowledge to the Information and Communication Technologies (ICT) domain.

We study nonlinear and spatio-temporal emission properties of semiconductor lasers, implement optical complex networks based on lasers, advance characterization techniques, and demonstrate the utility of optical complexity for information technologies including encryption and ultra-fast neuro-inspired photonic information processing.

NONLINEAR DYNAMICS IN FLUIDS

Fluid flows occur in a huge range of scales, from blood capillaries to atmospheric weather systems. The way in which substances are transported has large impacts, e.g., on how pollutants arrive to distant locations, plankton meets the nutrients, or into the whole heat balance involved in the Earth climate.

At IFISC we develop techniques useful to characterize transport in fluids, quantify stretching, mixing, and connectivity between parts of a fluid. We apply them to geophysical settings, mostly in the ocean. We develop tools to identify barriers to the transport of oxygen and nutrients, evaluate the ecological implications of larval transport, or track the origins of water vapor masses transported by atmospheric winds.

BIOCOMPLEXITY

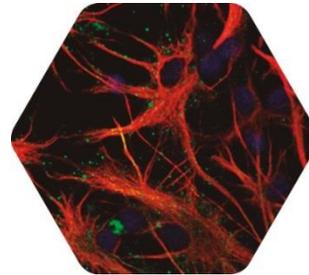

Living systems are the paradigm of complex systems, with nonlinear interactions occurring at all spatial and temporal scales, from molecules and genes to the planetary scales defining the global biosphere.

One of the focus of our research is the ecological level where we consider modes of organisms' mobility and their interplay with food search, disease propagation, spatial patterning, and also with the basic ecological interactions such as competition, predation, or mutualism.

Another focal issue in our studies is understanding brain function, which requires approaches at scales that range from individual neurons to the whole brain. At the neuronal level, we concentrate on aspects of synchronization between interacting neuronal populations and study how information flows. With the help of statistical measures, we analyze experimental data and compare the results with neuronal models.

COLLECTIVE PHENOMENA IN SOCIAL AND SOCIO-TECHNICAL SYSTEMS

Social systems are prominent examples of Complex Systems, emergent phenomena, and the Micro-Macro paradigm. Today's main societal changes and challenges arise from the feedback loop that entangles society with Information and Communication Technologies (ICT) as a prototypical socio-technical system.

In this line of research we develop new concepts, tools and models aiming at identifying generic mechanisms underlying collective phenomena in these systems. We do this in the framework of Computational Social Sciences with the use of Game Theory, Statistical Physics, Agent Based Models, Complex Networks Theory, and Big Data analysis. We study phenomena such as opinion formation, cooperation, cultural conflicts, language competition and social learning. Moreover, we focus on ICT data-driven research on socio-technical systems, addressing problems of human mobility, transportation, tourism, city science, epidemics, and energy consumption.

desarrollar la ciencia. Este es un reto que se ha convertido en un desafío. Por un lado, la investigación científica requiere un entorno de colaboración y trabajo en equipo. Por otro lado, la ciencia debe estar conectada con la sociedad y con los ciudadanos. La ciencia es una actividad que requiere un compromiso y una dedicación por parte de los investigadores y de la sociedad en general. La ciencia es una actividad que requiere un compromiso y una dedicación por parte de los investigadores y de la sociedad en general.

Un nuevo método matemático mide la integración o segregación de los inmigrantes a partir de sus tuits

La medición muestra ciudades con alta integración, como Londres, San Francisco, Tokio o Los Ángeles, y otras con un nivel bajo, como Detroit, Miami, Toronto o Ámsterdam.

Un equipo internacional dirigido por investigadores del Consejo Superior de Investigaciones Científicas (CSIC) ha desarrollado un método que permite medir la integración o segregación de los inmigrantes a partir de los mensajes que escriben en la red social Twitter.

En este trabajo, publicado en la revista **PLOS ONE**, se desarrolla un método para usar datos de Twitter para analizar el grado de segregación espacial de las comunidades inmigrantes. "La comunidad de origen de los usuarios se determina mediante el idioma de los tweets emitidos, estableciéndose una algebra idiomática para asignar la comunidad más probable a la que se pertenece", explica el director del estudio, José Javier Ramos, investigador del CSIC en el Instituto de Física Interdisciplinar y Sistemas Complejos, de Mallorca. "Si todos los mensajes son en idioma local, entonces se considera al usuario como residente local. Si, al contrario, algunos mensajes son en idiomas propios de las comunidades inmigrantes se puede asumir que dicho usuario conoce esa lengua
